y Micah Yates, Mike Scott, Brandon Levene, Jen Miller-Osborn and Tom Ke Plant 6.00 राजा Malware, Unit 42 Focus, BS2005, CVE-2015-2545, Ke3chang, Operation Ke3chang, TidePool

custom malware arsenal. We've discovered a new malware family we've named TidePool. It has strong behavioral ties to Ke3chang and is being used in an ongoing attack campaign against Indian embassy personnel worldwide. This targeting is also consistent with previous attacker TTPs; Ke3chang historically targeted the

Introduction

Ministry of Affairs, and also conducted several prior campaigns against India Though we don't have comprehensive targeting information, the spear phishing emails we found targeted several Indian embassies in different countries. One decoy references an annual report filed by over 30 Indian embassies across the globe. The sender addresses of the phishing emails spoof real people with ties to Indian embassies, adding legitimacy to the emails to prompt the recipients to open the attached file. Also noteworthy, the actors are exploiting a relatively new vulnerability in their attacks with TidePool, which is detailed below.

Little has been published on the threat actors responsible for Operation Ke3chang since the report was released more than two years ago. However, Unit 42 has recently discovered the actors have continued to evolve their

In this report we will highlight the reuse of the code responsible for a variety of registry changes and command and control traffic over time as the Ke3chang actor has evolved their codebase to TidePool since the 2013

The weaponized document sent in phishing emails triggers the vulnerability outlined in CVE-2015-2545, which was first made public in September 2015. Unlike previously seen exploit carrier docs, this version comes packaged as an MHTML document which by default opens in Microsoft Word. We have seen multiple waves of activity with similar exploit docs, including those referenced in our recent Spivy blog. PwC recently released a great report analyzing the exploit documents themselves. The samples we are covering are documented in the "Windows User_A" section of their report (the malware they refer to as "Danti Downloader").

The TidePool Malware Family

Exploitation of CVE-2015-2545

TidePool contains many capabilities common to most RATs. It allows the attacker to read, write and delete files and folders, and run commands over named pipes. TidePool gathers information about the victim's computer base64 encodes the data, and sends it to the Command and Control (C2) server via HTTP, which matches capabilities of the BS2005 malware family used by the Ke3chang actor The TidePool malware is housed in an MHTML document which exploits CVE-2015-2545. The exploit code drops a DLL into

service. For persistence, TidePool utilizes an ActiveSetup key, which will launch itself on boot with the following parameters: $rund II 32. exe C: \DOCUME~1 \land LLUSE~1 \land IEHelper \land mshtml. dll,, IEHelper \land mshtml. dll,, IEHelper \land mshtml. dll, IEHelper$

This dropped DLL is the TidePool sample. It also launches Internet Explorer as a subprocess of the sychost

C:\Documents and Settings\AllUsers\IEHelper\mshtml.dll

The TidePool sample then sends victim computer information to the C2 server, as shown in Figure 1. Once a connection is made, the sample behaves as a RAT, receiving commands from the C2.

Figure 1. The Base64 encoded data contains information about the victim's service pack level, the current user, and the NETBIOS name of the victim system The Evolution From BS2005 to TidePool During our initial triage of the TidePool samples in AutoFocus, we noticed Windows Registry modifications that by themselves were not unique, but when viewed together were used by multiple malware families. One of these families is the "BS2005" malware family used by the Ke3chang actor. This motivated us to dig deeper, since we had not seen any public reporting on them since 2013. From this analysis, Unit 42 compared the code bases of the new malware family, and the BS2005 malware samples. Based on our analysis we believe this new malware,

Figure 3. Comparing a BS2005 and post Ke3chang sample C2 obfuscation routine Not only do BS2005 and TidePool share repeating registry behaviors, they also use a similar code routine to obfuscate the C2. Further analysis shows that they also share similar Base64 string handling. This routine goes back even further to MyWeb malware samples, also associated with Operation Ke3chang.

Next we compared the codebase for setting registry keys. The code reuse displayed in Figure 4 is the sequence that sets the IEHarden registry keys and other keys used throughout TidePool and Operation Ke3chang malware.

Figure 4. Sequence that sets the IEHarden registry keys and other keys used in TidePool and Operation The code that handles URL beacon creation is shown in Figure 5. These functions also displayed quite a bit of

These samples are quite similar when looking at the library functions used, but the most notable features they have in common are the timeline of behaviors executed. Ke3chang and TidePool both modify the IEHarden registry key, as well as the following list of keys. Setting these registry keys is unique to the Ke3chang and

Despite going unreported on since 2013, Operation Ke3chang has not ceased operations and in fact continued developing its malware. Unit 42 was able to track the evolution of Operation Ke3chang's tools by observing unique behavioral quirks common throughout the malware's lineage. By pivoting on these behaviors in AutoFocus, we were able to assess a relationship between these families dating back to at least 2012 and the creation of TidePool, a new malware family continuing in Ke3chang's custom malware footsteps. While we can't know all of the groups' attacks using TidePool or older malware, we have uncovered its use against Indian

Embassies, which was also documented in the 2013 report, indicating this is likely a high priority target as it has a simple of the control of the control

Customers can utilize the Ke3changResurfaces AutoFocus tag to examine the samples discussed in this post. IPS coverage for TidePool is provided by TID 14588.

which we are calling TidePool, is an evolution of the BS2005 malware family used by the Ke3chang actor Unit 42 has discovered 11 similar registry modifications that both TidePool and BS2005 employ. The registry setting that TidePool and BS2005 focuses on is: When the IEHarden Value is set to 0 it disables the Internet Explorer Enhanced Security configuration, which is ne execution of scripts, ActiveX Con for HTML content. This is a technique common to both BS2005 and TidePool malware. Below is the routine within TidePool that modifies the IEHarden registry settings. The repetition, order, and uniqueness of the code base in this function allowed us to link TidePool back to older versions of BS2005 and $\frac{1}{2}$ and $\frac{1}{2}$ and $\frac{1}{2}$ and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine within TidePool back to older versions of BS2005 and $\frac{1}{2}$ are the routine withi

Attribution is an inexact process, however we have compiled several interesting findings which lend themselves to our conclusion that this activity and malware is related to the original Operation Ke3chang • Strong behavioral overlap between the TidePool malware family and malware called BS2005 utilized by • Strong code reuse and overlap showing a branching and evolution of malware from BS2005 to TidePool. • Targeting and attack method matches historic Ke3chang targeting. • When binaries included resources, encoding was 0x04 (LANG_CHINESE) indicating the actor's system is likely running an operating system and software with Chinese as the default display language. Conclusion
